

PLAN NOW FOR HIGH YIELDS AND QUALITY SPUDS

Between seasons is the time to plan and prepare, especially when it comes to potatoes. Looking ahead do you know what inputs you will use?

Consider JH Biotech, Inc. products. Here are three products that potato growers should consider using this season.

PENEX is a soil conditioner that breaks up clay or heavy soils to alleviate puddling and improve drainage. Moreover, **PENEX** breaks up the soil crust making harvesting easier. Don't let heavy soils interfere with your crop, use **PENEX**.

SUPERZYME is a biological product that boosts yield and promotes a healthy balance of microorganisms in the root zone. The beneficial bacteria in **SUPERZYME** are known to solubilize phosphorus, decompose organic matter, and produce growth promoting substances that stimulate plant growth. Improve your soil biology and your bottom line, use **SUPERZYME**.

FOSPHITE is JH Biotech's premiere phosphite product that controls early blight and late blight during the growing season, and it continues to provide protection from Pink Rot in the bin post-harvest. University of Idaho tests prove that **FOSPHITE** effectively controls these fungi. Controlling fungi means more quality potatoes in your bin and more dollars in your pocket.

BOOTH 59 S.U.B.

These are just some of the over 100 products that JH Biotech, Inc. offers for commercial food production. Also available are water conditioners, herbicide and pest control products, nutrients, micronutrients, fungicides, and microbiological products. JH Biotech has been manufacturing top-of-the-line products for commercial agriculture for 20 years. Find out more at www.jhbiotech.com.
