BIO-ACTIVATE[®] PLUS

5-0-0

Biological Product

BIO-ACTIVATE PLUS is a natural plant growth factor derived from microbial cultures and seaweed extracts. Through a unique fermentation process specific beneficial enzymes and amino acid complexes are produced. These complexes are combined with high quality extracts of *Ascophyllum nodosum* which is the most biologically active seaweed. When properly applied to the soil or foliage **BIO-ACTIVATE PLUS** can stimulate the plant to produce flowers, set fruit, increase sugar and solids content, make a more uniform fruit size and color, and reduce the effects of environmental stress.

Benefit of Using Bio-Activate Plus

- Increased harvest quantity and quality
- Increased size and firmness
- Uniformity in crop size and color
- Increased shelf life
- Resistance to environmental stress
- Enhanced nutrient bioavailability

Recommended Usage

For best results a “spoon feeding” approach works best. Apply **BIO-ACTIVATE PLUS** four to five times in a growing season. It is recommended that applications be made in the morning or late afternoon to avoid the mid-day sun. Avoid the application of **BIO-ACTIVATE PLUS** when the temperature exceeds 100°F (38°C). **BIO-ACTIVATE PLUS** should be applied with a balanced fertilizer program. Balanced nutrients and normal growing conditions are required for maximum performance of **BIO-ACTIVATE PLUS**.

STRAWBERRY:

FOLIAR APPLICATION: Apply 12-16 fluid ounces of **BIO-ACTIVATE PLUS** per acre in 10 - 30 gallons of water. Make the first application two weeks prior to flowering. Follow up with the second application 1-2 weeks after flowering with subsequent applications at 2 - 3 week intervals.

SOIL APPLICATION: **BIO-ACTIVATE PLUS** can be applied directly to seeds or as a banding at planting time to stimulate germination and root growth. Dilute **BIO-ACTIVATE PLUS** with at least 50 times with water or fertilizer solution.
